YOUR CHECKLIST

1. Check the settings on your thermostat. Make sure the temperature control selector is set above room temperature, and the system switch is on the COOL or AUTO position. The fan switch should be set to ON for continuous airflow or AUTO if you want the blower to operate only while the air conditioner is operating.

2. Try to get the air conditioner to turn on by lowering the thermostat to its lowest temperature setting.

3. If the air flow out of your registers seems low, check the air filter. An extremely dirty air filter can block airflow.

4. Make sure all the registers are open and not obstructed.

5. Check the power disconnect switch by both units (outdoor and indoor).

6. Check the fuse/breaker at the electrical panel for both the outdoor and indoor units.

7. Check the furnace blower door and make sure it is secure.

8. Check the outdoor unit for debris.

9. Check the batteries in your electronic thermostat.

10. If the problem persists, please give us a call!
